## Weathering Results

Figure 13: Calcium Weathering (All Layer)

Figure 14: Magnesium Weathering (All Layer)

Figure 15: Potassium Weathering (All Layer)

Figure 16: Aluminum Weathering (All Layer)

Figure 17: Phosphate Weathering (All Layer)

Figure 18: Silica Weathering (All Layer)

Figure 19: Sodium Weathering (All Layer)

## Litter Pool Results

(a) Total forest floor carbon content (kg/ha)

(b) Carbon content of coarse litter (kg/ha)

Figure 20: Forest Floor (O-Layer) Carbon Content Over Simulation Period

(a) Carbon content of fine litter (kg/ha)

(b) Carbon content of humic litter (kg/ha)

Figure 21: Forest Floor (O-Layer) Carbon Content Over Simulation Period

Note that the fine litter pool (the stage between humus and fresh/coarse litter) is growing in this model. This might deviate from observed behavior.

(a) Ca Content in each litter decomposition stage (kg/ha)

(b) Ca net annual return in litterfall (kg/ha)

Figure 22: Forest Floor/O-horizon Ca content over time (a). and net annual Ca return in litterfall (b).

## Soil Organic Matter Results

(a) Mg Content in each litter decomposition stage (kg/ha)

(b) Mg net annual return in litterfall (kg/ha)

Figure 23: Forest Floor/O-horizon Mg content over time (a). and net annual Mg return in litterfall (b).

(a) K Content in each litter decomposition stage (kg/ha)

(b) K net annual return in litterfall (kg/ha)

Figure 24: Forest Floor/O-horizon K content over time (a). and net annual K return in litterfall (b).

(a) S Content in each litter decomposition stage (kg/ha)

(b) S net annual return in litterfall (kg/ha)

Figure 25: Forest Floor/O-horizon S content over time (a). and net annual S return in litterfall (b).

(a) P Content in each litter decomposition stage (kg/ha)

(b) P net annual return in litterfall (kg/ha)

Figure 26: Forest Floor/O-horizon P content over time (a). and net annual P return in litterfall (b).

(a) N Content in each litter decomposition stage (kg/ha)

(b) N net annual return in litterfall (kg/ha)

Figure 27: Forest Floor/O-horizon N content over time (a). and net annual N return in litterfall (b).

I plotted the litterfall return rate and the O-horizons next to each other to show that the inability of the O-horizon to build up certain nutrients is not an issue with nutrient release (these values can be set to be very low, such as 0.05 for Ca and Mg, and losses are still observed), but likely due to a gradual depletion of the soil for specific nutrients. The site builds up with N in the O-horizon, and this likely implies that the system is not limited by N, but that base cations are becoming increasingly limited over time, with the exception of K.

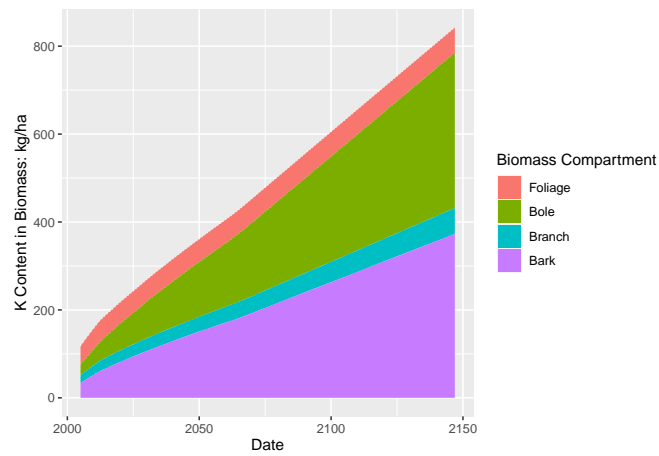

## Tree Nutrient Content

(a) Calcium content in each biomass compartment

(b) Magnesium content in each biomass compartment

(c) Potassium content in each biomass compartment

Figure 28: Base Cation Nutrient Content in Simulated Forest

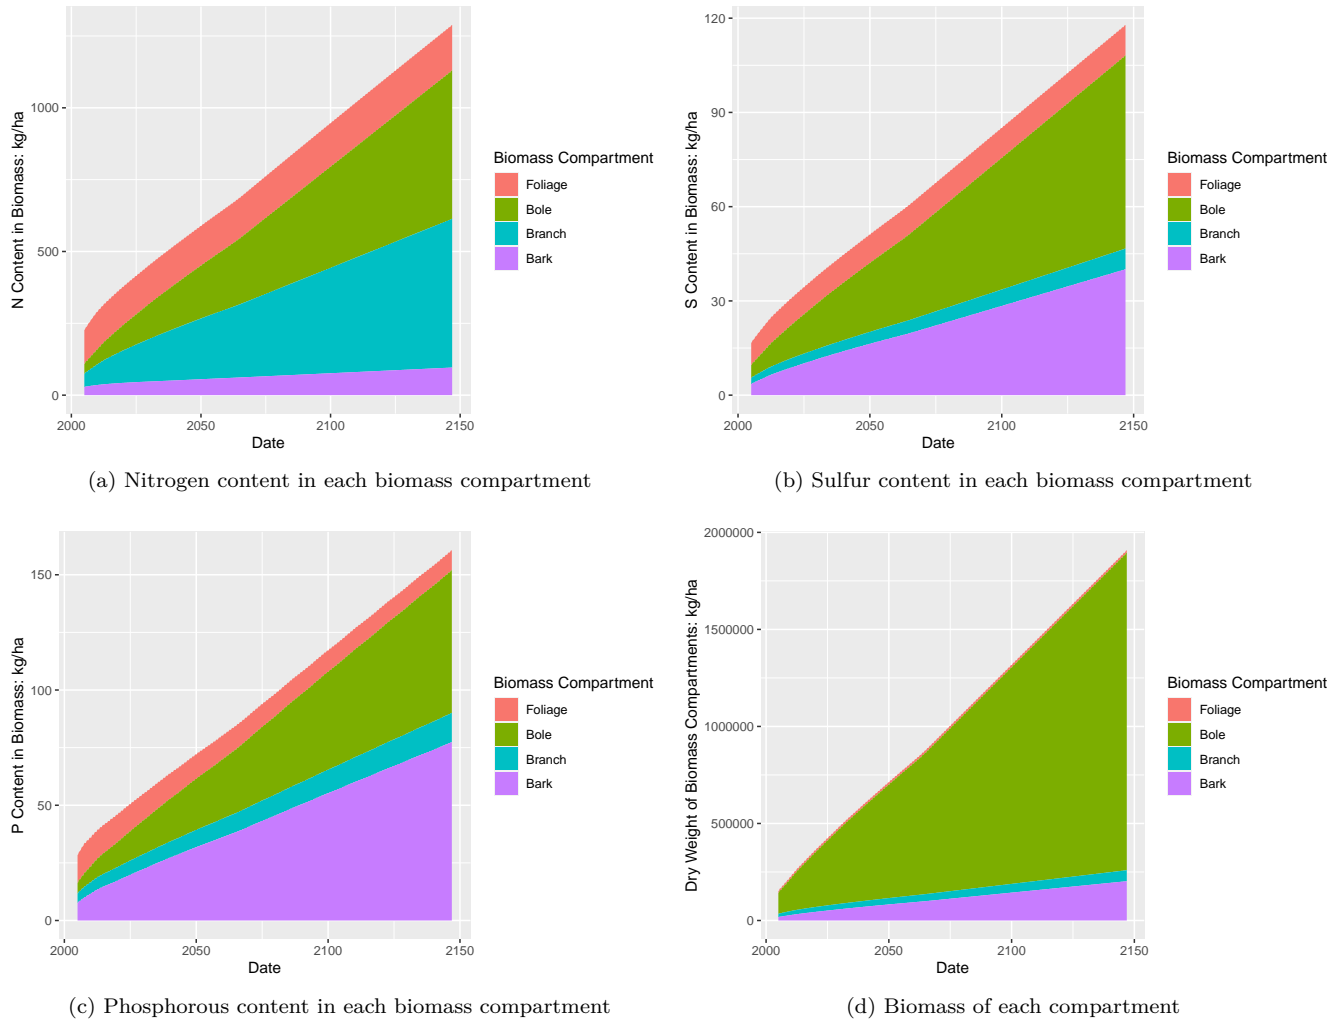

Figure 29: N, S, and P Nutrient Contents and biomass per compartment

### Analysis 1: Stack Flux Data

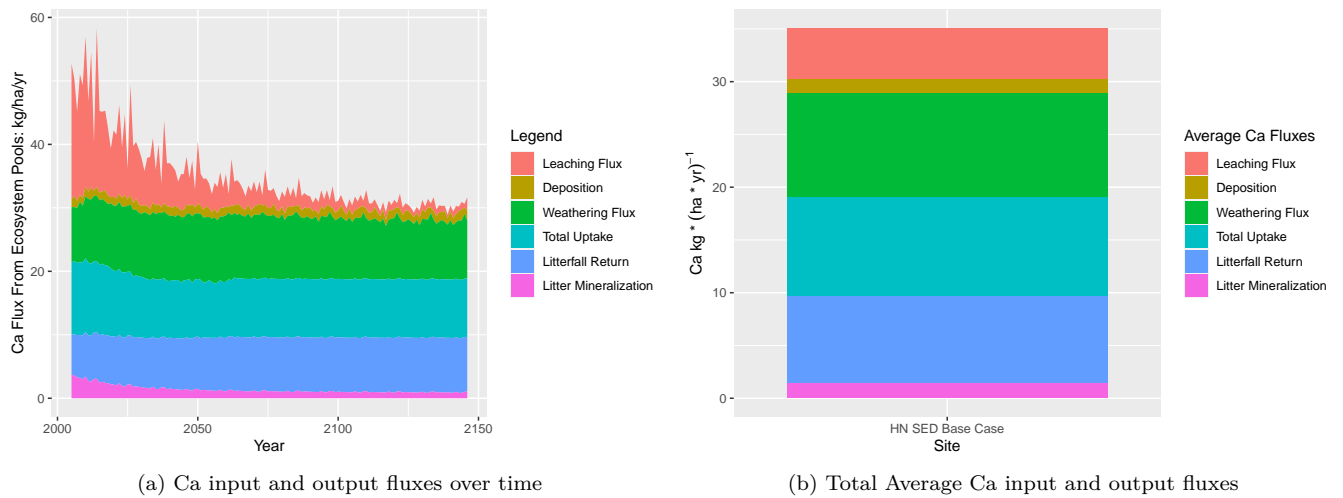

Figure 30: Calcium input and output comparison graphs

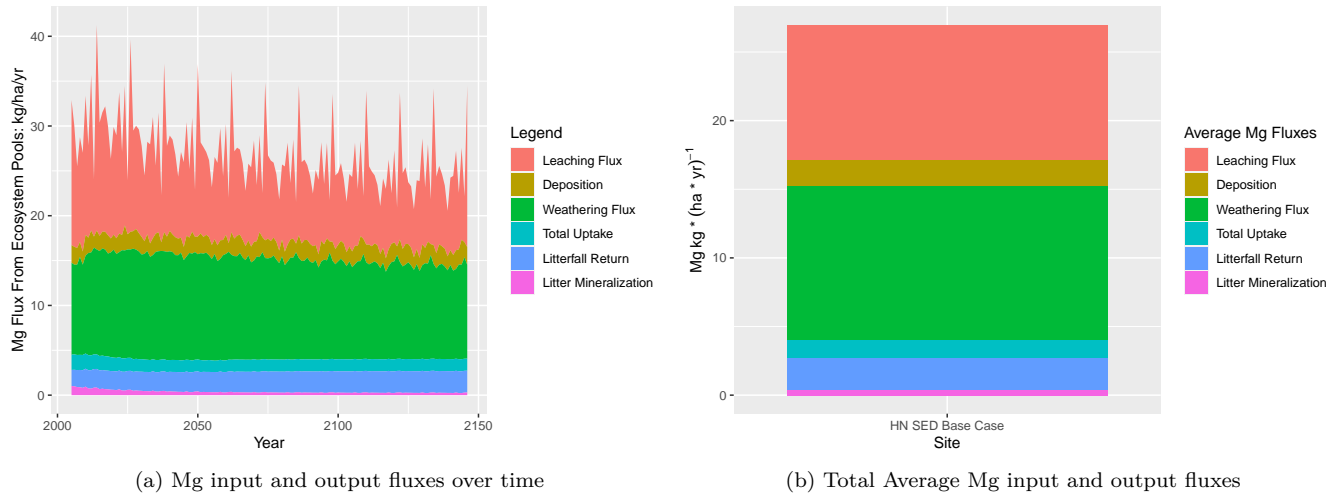

Figure 31: Magnesium input and output comparison graphs

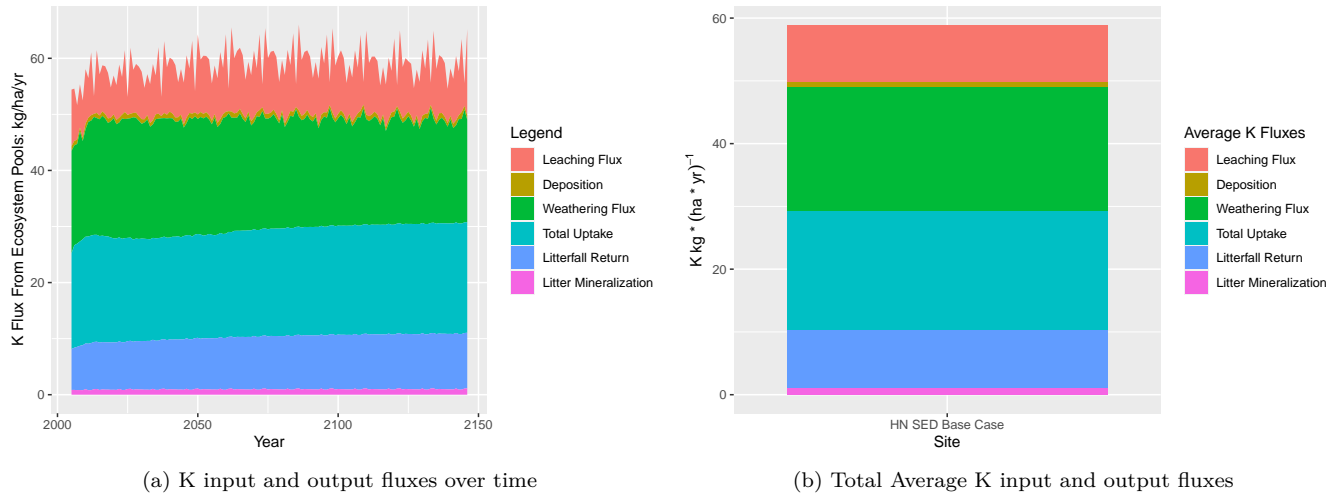

Figure 32: Potassium input and output comparison graphs

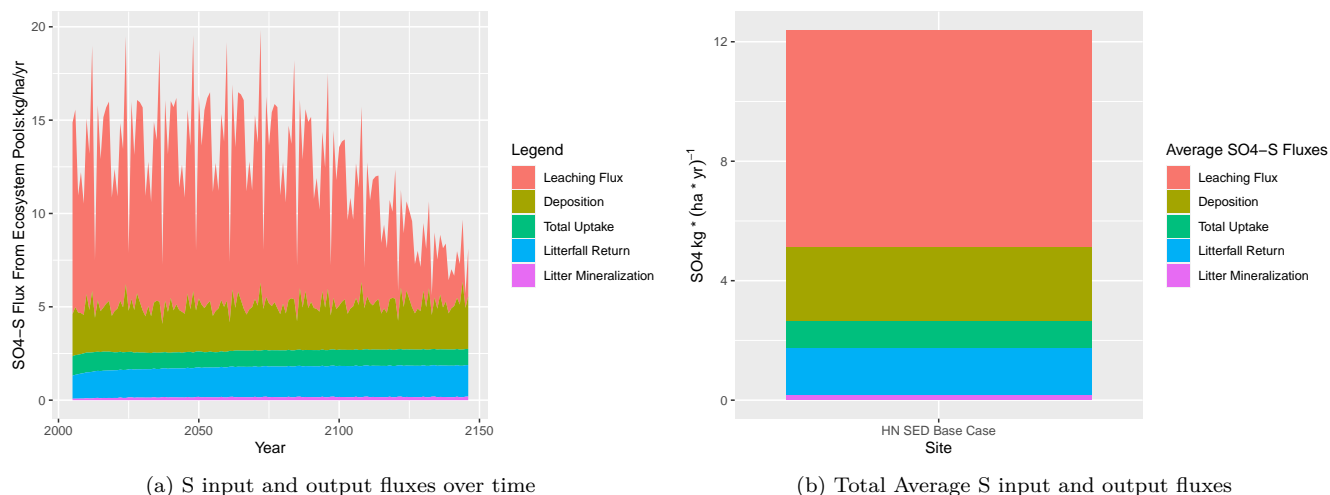

Figure 33: Sulfur input and output comparison graphs

I added back a reasonably large sulfate pool, this caused enhanced S losses which were unrealistic. This likely implies that the system had too much S going through it.

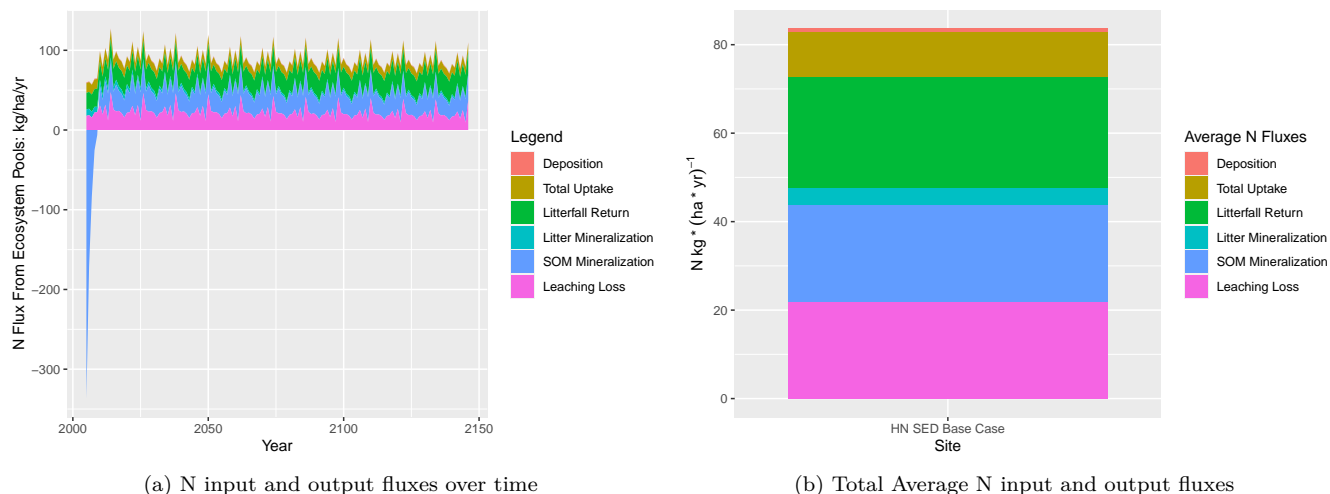

Figure 34: Nitrogen input and output comparison graphs

Notice how SOM mineralization starts off highly negative (-358 kg/ha/yr N); implying a large net N uptake in the microbial pool. The mineralization then balances out and steadily returns N to the soil over time, behaving normally. I do need the microbial pool to help calibrate the N cycle, but I may need to reduce the CEC stabilized N and decrease the N-uptake in the microbial pool. These results likely imply too much N is going through the system and that the microbial pool is too large of an N pool.

## Cation Exchange Capacity

Figure 35: Calcium and Magnesium CEC adsorption over time

Figure 36: Potassium and Sodium CEC adsorption over time

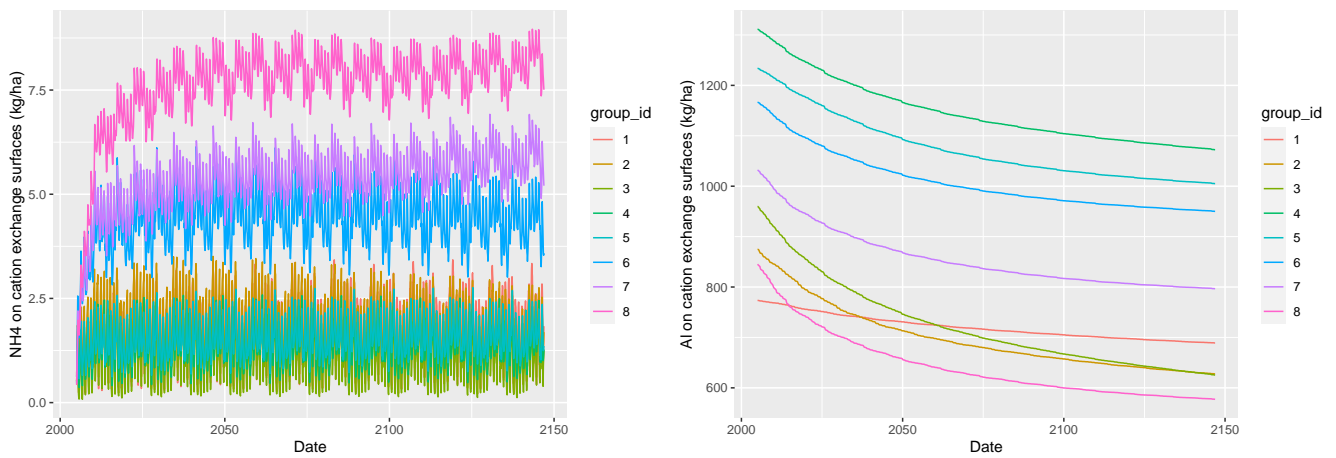

Figure 37: Ammonium and Aluminum CEC adsorption over time

## Anion Exchange Capacity

Phosphate seems stable, generally. It should be noted that P uptake is not being modeled in the foliage (it should remain constant so far) and that phosphate adsorption parameters are completely borrowed from the Burgundy site. As for sulfate, I purged the model of the AEC sulfate pool and relegated all soil S to the SOM organic pool.

I further note that the ALSEA rain chemistry seems to be lacking in Na and Cl, when I completely take away Cl adsorption, I don't get anywhere near the concentration of Cl measured in the lysimeters, like I do for sulfate.

## Other
